

## Field Adjustable Pressure Reducing (regulating) Brass Hose Valves

These valves can be adjusted to provide a range of outlet pressures and flow rates, and can be calibrated or re-calibrated in the field. The valves are designed for use as a fire hose rack assembly valve or sprinkler control valve where pressure requires regulation to reduce inlet pressure of up to **400 PSI** to the range of **65 to 175 PSI**. This valve can also act as a check valve which does not allow a reverse flow from downstream to upstream. Valves should be installed by qualified personnel only.

- Cast bronze valve with female visual indicator and red hand wheel
- The inlet on the lower part is indicated by an arrow
- U/L listed and FM Approved
- Working pressure up to **400 PSI**
